                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc under the control of the polyhedrin promoter. The invention cc provides nucleic acids (see AAA88919-24) encoding pesticidal fusion crowdides nucleic acids (see AAA88919-24) encoding pesticidal fusion crowdides comprising a toxin domain and a heterologous binding domain capable of binding non-specifically to a cell membrane without disrupting that membrane. The toxin domain is preferably obtained from Bacillus thuringiensis crystal proteins CryIA(b) or CryIA(c), and the binding domain is preferably derived from a lectin, especially cricin toxin B chain. The use of such fusions may help to inhibit the acquisition of resistance in a pest population treated with the protein. Vectors (e.g. bacullovirus vectors or vectors suitable for creating are also provided. Expression of the fusion protein in a collant to a pest, allowing control of e.g. Lepidoptera, Coleoptera, Collicidae, Simuliidae, Hymenoptera, Homoptera, Diptera and

The use of such fusions may help to inhibit the acquisition of resistance in a pest population treated with the protein. Vectors (e.g. baculovirus vectors or vectors suitable for use in a plant), host cells, and transpenic plants (especially rice or maize) are also provided. Expression of the fusion protein in a plant is useful for influencing or affecting the toxicity of a plant is useful for influencing or affecting the toxicity of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of ricin toxin B chain RTB2 DNA in baculovirus transfer vector pFASTBAC1, in which the DNA was cloned under the control of the polyhedrin promoter. The invention provides nucleic acids (see AAAB8919-24) encoding pesticidal fusion proteins comprising a toxin domain and a heterologous binding domain capable of binding non-specifically to a cell membrane without disrupting that membrane. The toxin domain is preferably obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ricin toxin B; RTB1; crystal protein; insecticide; pesticide; toxin; transgenic plant; insect resistance; crop protection; lectin; pFASTBAC1; ds.
comprising a toxin resistant to pests
                              Novel nucleic acid molecule encoding a pesticidal fusion polypeptide comprising a toxin and a binding domain for producing transgenic plan
                                                                                                                               WPI; 2001-007228/01.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of ricin toxin B chain RTB1 DNA in CC baculovirus transfer vector pFASTBACI, in which the DNA was cloned under the control of the polyhedrin promoter. The invention crowder the control of the polyhedrin promoter. The invention provides nucleic acids (see AAA88919-24) encoding pesticidal fusion proteins comprising a toxin domain and a heterologous binding domain cropable of binding non-specifically to a cell membrane without control of the toxin domain is preferably obtained from Bacillus thuringiensis crystal proteins CrylA(c), condition toxin B chain. The use of such fusions may help to inhibit the acquisition of resistance in a pest population treated with the protein. Vectors (e.g. baculovirus vectors or vectors suitable for use in a plant), host cells, and transgenic plants (especially rice cor maize) are also provided. Expression of the fusion protein in a cor plant is useful for influencing or affecting the toxicity of a corthorors as allowing control of e.g. Lepidoptera, Coleoptera, Collicidae, Simulidae, Hymenoptera, Homoptera, Diptera and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Loc

The polynucleotide encoding the protease is useful for identifying, detecting or isolating mutant forms of DNA molecules encoding the protease. The protease is useful for identifying modulators of the functional protease. The D-G protein can be used for formulation of compositions for laundry detergents and skin care products. Protease D-G gene therapy may be used to introduce protease D-G into the cells of target organisms. As the D-G protein is derived from a human, it is less likely to produce an allergic reaction in sensitive individuals when used in formulations for laundry detergents and skin care products. The current sequence represents the protease D-G cataytic domain in the
                                                                                            05-JUL-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                which play an important role in processes such as digestion and regulatory amplification cascades through the proteolytic activation of inactive zymogen precursors. Protease D-G modulating compounds are useful for treating a condition which is mediated by protease D-G, e.g. cancer, skin disorders, neuropathic pain, inflammatory disorders, or coagulation skin disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated and purified nucleic acid that encodes a serine protease called D-G protein. The activity of the protein of the invention may be described as cytostatic, antiinflammatory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid encoding a serine protease called D-G protein which useful for identifying modulators that are useful for treating a condition which is mediated by protease D-G, e.g. cancer, skin disorders, or neuropathic pain -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes an active polypeptide fragment. The active colypeptide has a molecular weight of 700-17,000 Da (as measured by comass spectrometry), and is derived from ectoparasitic leeches, of order Rhynchobdellida, of genus Placobdella and especially of species P. papillifera. The polypeptide inhibits the alternate route of CC complement activation but has substantially no effect on complement activation but has substantially no effect on complement complement factor D and/or C3bBb complex. The active polypeptide is useful for manufacturing a medicament and inhibits one or more steps in the alternate pathway of complement activation. It is useful for treating or preventing conditions, such as haemodialysis and CC cardio-pulmonary bypass, the presence of in-dwelling catheters and controlmune diseases including lupus arthritis, rheumatoid arthritis, autoimmune diseases including lupus arthritis, rheumatoid arthritis, cassociated with activation of complement, including anaphylaxis.

CC antenna, skin reactions, infections, sickle cell anemia and haemolytic antenna involving activation of alternate complement pathway in a

The invention provides nucleic acids (see AAA88919-24) encoding pesticidal fusion proteins comprising a toxin domain and a heterologous binding domain capable of binding non-specifically to a cell membrane without disrupting that membrane. The toxin domain is preferably obtained from CryIA(b) or CryIA(c), and the binding contain. The use of such fusions may help to inhibit the acquisition of resistance in a pest population treated with the protein. Vectors (e.g. baculovirus vectors or vectors suitable for use in a plant), host cells, and transgenic plants (especially rice or maize) are also provided. Expression of the fusion protein in a plant is useful for influencing or affecting the toxicity of a plant to a pest, allowing control of e.g. Lepidoptera, Coleoptera, Culcicidee, Simuliidae, Hymenoptera, Homoptera, Diptera and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which the gene was cloned under the control of the polyhedrin of promoter. The invention provides nucleic acids (see AAA88919-24) cencoding pesticidal fusion proteins comprising a toxin domain and a heterologous binding domain capable of binding non-specifically to a cell membrane without disrupting that membrane. The toxin domain is preferably obtained from CryIA(b) or CryIA(c), and the binding domain is preferably derived from a lectin, such as ricin toxin B chain. The use of such fusions may help to inhibit the acquisition of resistance in a pest population treated with the protein. Vectors (e.g. baculovirus vectors or vectors suitable for use in a plant), host cells, and transgenic plants (especially rice or maize) are also provided. Expression of the fusion protein in a complant to a pest, allowing control of e.g. Lepidoptera, Coleoptera, Culcicidee, Simuliidae, Hymenoptera, Homoptera, Diptera and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This nucleotide sequence is that of a fusion between DNA encoding crystal protein CryJA(b) (see AAA88914) of Bacillus thuringiensis and DNA encoding ricin toxin B RTB3 (see AAA88918) in baculovirus transfer vector pFASTBAC1, in which the fusion was cloned under the control of the polyhedrin promoter. This is an example of claimed nucleic acids encoding pesticidal fusion proteins between a toxin domain and a heterologous binding domain capable of binding non-specifically to a cell membrane without disrupting that membrane. The use of such fusions may help to inhibit the acquisition of resistance in a pest population treated with the protein. Vectors (e.g. baculovirus vectors or vectors suitable for use in a plant), host cells, and transgenic plants (especially rice or maize) are also provided. Expression of the fusion protein in a plant is useful for influencing or affecting the toxicity of a plant to a pest, allowing control of e.g. Lepidoptera, Coleoptera, Culicidae, Simuliidae, Hymenoptera, Chaptera pests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

DNA encoding

This nucleotide sequence is that of a fusion between DNA encoding crystal protein Cryst(b) (see AAA88914) of Bacillus thuringiansis and DNA encoding ricin toxin B RTB2 (see AAA88917) in baculovirus transfer vector pFASTBAC1, in which the fusion was cloned under the control of the polyhedrin promoter. This is an example of claimed nucleic acids encoding pesticidal fusion proteins between a toxin domain and a heterologous binding domain capable of binding non-specifically to a cell membrane without disrupting that membrane. The use of such

Claim 11; Fig 3g; 81pp; English

to pests

Novel nucleic acid molecule encoding a pesticidal fusion polypeptide comprising a toxin and a binding domain for producing transgenic plants

WPI; 2001-007228/01.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC crystal protein CryIA(c) (see AAA88915) of Bacillus thuringiensis and CC DNA encoding ricin toxin B RTB3 (see AAA88918) in baculovirus transfer CC vector pPASTBAC1, in which the fusion was cloned under the control CC of the polyhedrin promoter. This is an example of claimed nucleic CC acids encoding pesticidal fusion proteins between a toxin domain CC and a heterologous binding domain capable of binding non-specifically CC acids encoding the pestic protein between a toxin domain CC and a heterologous binding domain capable of binding non-specifically CC captures without disrupting that membrane. The use of such CC fusions may help to inhibit the acquisition of resistance in a pest CC copulation treated with the protein. Vectors (e.g. baculovirus CC vectors or vectors suitable for use in a plant), host cells, and CC transgenic plants (especially rice or maize) are also provided. CC Expression of the fusion protein in a plant; is useful for influencing CC or affecting the toxicity of a plant to a pest, allowing control of CC e.g. Lepidoptera, Coleoptera, Culicidae, Simuliidae, Hymenoptera, CC Homoptera, Diptera and Orthoptera pests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

CC fusions may help to inhibit the acquisition of resistance in a pest CC population treated with the protein. Vectors (e.g. baculovirus CC vectors or vectors suitable for use in a plant), host cells, and CC transgenic plants (especially rice or maize) are also provided.
CC Expression of the fusion protein in a plant is useful for influencing CC or affecting the toxicity of a plant to a pest, allowing control of CC e.g. Lepidoptera, Coleoptera, Culicidae, Simuliidae, Hymenoptera, CC Homoptera, Diptera and Orthoptera pests.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note=Worgan: brain; Vector: pBluescript II KS(+); Site_1: EcoRI; Site_2: Not1; This normalized library was constructed Trom 1 million independent clones. cDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction. Following this first strand reaction, double-stranded cDNA was blunted, ligated to NotI adapters, digested with EcoRI size-selected, and cloned into the NotI and EcoRI compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reannealing hybridization was used."

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purfited and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD2 (gil 4732114 gb) AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

/note="Vector: pHSS6-Sa1; A yeast genomic DN library
(lacking mitochondrial DNA) was prepared in pHSS6-Sa1;
genomic DNA was size-fractionated (DNA of roughly 2-3 kb
in length) prior to cloning. This library was
subsequently mutagenized with a mTn-3xHA/lacZ
minitransposon containing lacZ, URA3, and tet resistance.

//clome_Trgan: Root; Vector: pBK-CMV; Site_1: EcoRI;
/note="Organ: Root; Vector: pBK-CMV; Site_1: EcoRI;
Site_2: XhoI; cDNA was synthesized from a pooled mRNA preg
from_elongating root hairs (30% w/w) and 2-3cm root tips
(70% w/w). XhoI-oligo-dT linker-primer and EcoRI
adaptors were used. cDNAs was cloned unidirectionally
into lambda ZAP Express (Stratagene), amplified, and
mass-excised into pBK-CMV vector plasmids. More

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleotide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mpl9, .b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a. "

/notes="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was dispested with XbaI and one nucleotide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mpl9. b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a. "

// Rice is the most important food crop in the world. Half of
the world population, especially those inhabiting highly
populated areas of the humid tropics and subtropics, rely
on rice as their primary source of carbohydrate.

Monocotyledonous rice is a diploid plant (2n=24) with a
haploid genome equivalent of 431 Mbp (Arumuganathan and
Earle, 1991). The relatively small genome of rice, three
times larger than that of Arabidopsis, makes it suitable
for genomic studies. In order to facilitate positional
cloning, physical mapping and genome sequencing of rice,
we have constructed a BAC library from Oryza sativa,
Nipponbare variety using ECORI as the cloning enzyme. The
library contains 55,296 clones with an average insert size
of 121 Kb providing approximatley 15 haploid genome
equivalents. The deep coverage allows the isolation a
particular sequence with a probability of 99,9%. Three
high density filters, each containing 18,432 clones
(doubly spotted), represent the whole library for colony
screening and can be requested from the Clemson university
BAC/EST Resource Center (www.genome.clemson.edu)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes genetically modified cells (A) containing CC a polynucleotide (I) that encodes a polyneptide with heparanase activity, CC and express recombinant heparanase (II). Heparanase cleaves heparan CC sulphate (HS) at specific intrachain sites, resulting in release of the parin-binding growth factors, enzymes and proteins that are sequestered CC by HS in basement membranes, extracellular matrix or cell surfaces. It CC may also be implicated in tumour angiogenesis and metastases. (II) is CC restensis, atheroscletosis, inflammation, neurodegeneration, viral CC infection and cystic fibrosis. It can also be used to neutralise heparin CC (an alternative to protamine) and to screen for specific inhibitors CC (potentially useful for treating cancer and metastases). Antibodies CC raised against (II) are used for immunodetection and diagnosis of CC micrometastases, autoimmune lesions and kidney failure. (A) provide (II) CC in large quantities, in a form that is homogeneously processed and activated/neutralised by a dedicated protease. The present sequence represents a PCR primer for human heparanase, which is used in an CC example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antianaemic, neuroprotective, nootropic, cerebroprotective, antibacterial, virucide, protozoacide, fungloide, antiinflammatory, cardiant and immunosuppressive. Modulating expression of heparanase gene using constructs of the invention is useful for facilitating targeted control of disease states such as tumour metastasis, inflammatory diseases, allograft rejection, and for inhibiting processes such as cell migration, angiogenesis, and degradation of the basement membrane and/or extracellular matrix. Heparanase-targeted DNA binding domains modulates gene expression, and are useful for therapeutic or prophylactic applications, for e.g. cancer, isohaemia, diabettc retinopathy, macular degeneration, rheumatoid arthritis, psoriasis, HIV infection, sickle cell anaemia, Alzheimer's disease, muscular dystrophy, neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diseases, vascular disease, cardiovascular disease, cystic fibrosis, stroke, and bacterial, protozoal, fungal and viral infection. Constructs of the invention may also be useful in gene therapy. The current sequence represents a human heparanase gene specific primer designated HP-6. This was used in the determination of nucleotide sequences in the human

diagnostic of diseases associated with inappropriate secretory grotein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples. They may also be used to study the expression and function of secretory proteins/membrane polypeptides and their role in metabolism. The polypeptides may be used as antigens in the production of antibodies against them and in assays to identify modulators (agonists and antagonists) of expression and activity. The antibodies and antagonists may also be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid

Included in the invention are primers AAF932917 - AAF93295 and AAF62232 - AAF62235 which are used to isolate to cDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA sequences, which can be used in vaccines. The polynucleotide sequences can be used in gene therapy. The polynucleotide sequences and the proteins they encode may be used in the prevention, treatment and discount of discount and the proteins they encode may be used in the prevention, treatment and

                                                                                                                                                                                     antianaemic, neuroprotective, nootropic, cerebroprotective, antianaemic, neuroprotective, nootropic, cardiant and immunosuppressive. Modulating expression of heparanase gene using constructs of the invention is useful for facilitating targeted control of disease states such as tumour metastasis, inflammatory diseases, allograft rejection, and for inhibiting processes such as cell migration, angiogenesis, and degradation of the basement membrane and/or extracellular matrix. Heparanase-targeted DNA binding domains modulates gene expression, and are useful for therapeutic or prophylactic applications, for e.g. cancer, ischaemia, diabetic retinopathy, macular degeneration, rheumatoid arthritis, psoriasis, HIV infection, sickle cell anaemia, Alzheimer's disease, cardiovascular disease, cystic fibrosis, stroke, and bacterial, protozoal, fungal and viral infection. Constructs of the invention may also be useful in gene therany. The current semence of the invention may also be useful in gene therany.
                                                                                                                                                        stroke, and bacterial, provident, constitution may also be useful in gene therapy.

of the invention may also be useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                        sequences from the regulatory regions upstream and downstream of the coding region. The activity of polynucleotides of the invention may described as, cycostatic, vasotropic, antidiabetic, anti-HIV, ophthalmological, antirheumatic, antiarthritic, antipsoriatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 such

diseases, allograft rejection, and for inhibiting processes such as cell migration, angiogenesis, and degradation of the basement membrane and/or extracellular matrix. Heparanase-targeted DNA binding domains modulates gene expression, and are useful for therapeutic or prophylactic applications, for e.g. cancer, ischaemia, diabetic retinopathy, macular degeneration, rheumatoid arthritis, psoriasis, HIV infection, sickle cell anaemia, Alzheimer's disease, muscular dystrophy, neurodegenerative diseases, vascular disease, cystic fibrosis, stroke, and bacterial, protozoal, fungal and viral infection. Constructs of the invention may also be useful in gene therapy. The current sequence represents the human heparanase upstream sequence containing exons 1 and
                                                                                                                                                                                                                                                                                                                          sequences from the regulatory regions upstream and downstream of the coding region. The activity of polynucleotides of the invention may be described as, cytostatic, vasotropic, antidiabetic, anti-HIV, ophthalmological, antirheumatic, antiarthritic, antipsoriatic, antianaemic, neuroprotective, nootropic, cerebroprotective, antibacterial, virucide, protozoacide, fungicide, antinflammatory, cardiant and immunosuppressive. Modulating expression of heparanase gene using constructs of the invention is useful for facilitating targeted

                                                                                                             atherosclerosis, tumour growth and progression, fibroproliferative disorders, and central nervous system (CNS) and neurodegenerative diseases. The products can also be used for detection and diagnosis. I purified heparanase, both recombinantly produced human heparanase and heparanase isolated from human platelet activity, allows for the convenient selection of compounds having anti-heparanase activity, i.e. inhibitors of heparanase activity, by measuring inhibition of heparanase activity can be measured blocking heparanase-mediated release of radioactive fragments from in
                                                                                                                                                                                                                                              This sequence encodes the human pre-proheparanase of the invention. This sequence was isolated from human platelets. The heparanase can be used for identifying agents which alter heparanase activity. The heparanase can be used for wound healing or for blocking angiogenesis or inflammation. It can be used for treating e.g. psoriasis, diabetic retinopathy or solid tumours, or for the degradation of heparin and the neutralisation of heparin's anticoagulant properties during surgery. Inhibitors of heparanase activity can be used in the treatment of arthritis, asthma, and other inflammatory diseases, vascular restenosis, atherosclerosis, tumour growth and progression, fibroproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; pre-proheparanase; platelet; wound healing; angiogenesis blocker; inflammation, psoriasis; diabetic retinopathy; solid tumour; arthritis; heparin degradation; anticoagulant neutralisation; asthma; CNS disease; inflammatory disease; vascular restenosis; atherosclerosis; diagnosis; tumour growth; fibroproliferative disorder; neurodegenerative disease;

                                                                                                                                                                                                                                               The invention relates to nucleic acid sequences that encode heparanase enzymes having endoglucuronidase activity. Recombinant heparanases are capable of removing the HS side chain from heparan sulfate proteoglycan (HSPG). Sulfated oligosaccharides, sulphonates or HSPG can be used to inhibit heparanase, this is useful for treatment of a physiological or medical condition associated with elevated heparanase activity, such as metastasis, angiogenesis, wound healing, angioplasty-induced restenosis, arteriosclerosis, atherosclerosis and inflammation. The human, murine an
                                                                                                                                                  rat heparanases can be used to enhance wound healing, especially associated with tissue development and repair. The conditions mentioned above can be diagnosed using specific antibodies, and also using primers and probes specific for the heparanase polymucleotides. Other uses of the heparanases include sequencing sulfated molecules such as HSPG. The present sequence represents a DNA encoding human heparanase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heparanase; endoglucuronidase; heparan sulfate proteoglycan; enzyme; metastasis; angiogenesis; wound healing; angioplasty-induced resteno arteriosclerosis; atherosclerosis; inflammation; tissue development;

                                                                                                                                                                                                                                                                                             The specification describes a polypeptide having heparanase (hpa) activity. The recombinant protein is used as a modulator of heparin-binding growth factors, cellular responses to heparin-binding growth factors and cytokines, cell interaction with plasma lipoproteins, cellular susceptibility to viral, protozoal and bacterial infections or disintegration of neurodegenerative plaques. Heparanase may be useful for conditions such as wound healing, angiogenesis, restenosis, athersclerosis, inflammation, neurodegenerative diseases, and viral infections. Mammalian heparanase antibodies may be applied for immunodetection and diagnosis of micrometastases, autoimmune lesions, and creat failure in biopsy specimens, plasma samples, and body fluids.

                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a human protein with heparanase catalytic activity. The heparanase (hpa) polynucleotide is useful in gene therapy, particularly in treating tumour, inflammation or autoimmunity. Particularly, the polynucleotide is useful in modulating the bioavailability of heparin-binding growth factors, cellular responses to heparin-binding growth factors (e.g. bFGP) and cytokines (e.g. interleukin (IL)-8), cell interaction with plasma lipoproteins, cellular susceptibility to certain viral and some bacterial and protozoa infections, or disintegration of neurodegenerative plaques. The polynucleotide is also useful in wound healing (e.g. thermal, chemical
                                                                                                                                                                                                                                                                   or radiation burns), and in the treatment of angiogenesis, restenosis, atherosclerosis, inflammation, neurodegenerative diseases (Gerstmann-Straussler Syndrome or Creutzfeldt-Jakob disease), and some viral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides encoding a polypeptide having heparanase activity, useful in wound healing and in gene therapy, particularly in treating tumour, inflammation, autoimmunity, neurodegenerative diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (INSI-)

                                                                                                                                                                            The present invention describes genetically modified cells (A) containing CC a polynucleotide (I) that encodes a polynucleotide (I) that encodes a polynucleotide with heparanase activity, cc and express recombinant heparanase (II). Heparanase cleaves heparan CC sulphate (HS) at specific intrachain sites, resulting in release of the parin-binding growth factors, enzymes and proteins that are sequestered CC by HS in basement membranes, extracellular matrix or cell surfaces. It comes also be implicated in tumour angiogenesis and metastases. (II) is constituted in wound healing and for treating angiogenesis, crestensis, it for the protein and cystic fibrosis. It can also be used to neutralise heparin CC (an alternative to protamine) and to screen for specific inhibitors (potentially useful for treating cancer and metastases). Antibodies CC (potentially useful for treating cancer and metastases). Antibodies CC raised against (II) are used for immunodetection and diagnosis of CC micrometastases, autoimmune lesions and kidney failure. (A) provide (II) can large quantities, in a form that is homogeneously processed and CC activated neutralised by a dedicated protease. The present sequence

The invention relates to heparanase DNA and protein sequences are useful in wound healing, angiogenesis, restenosis, atherosclerosis, inflammation, pulmonary diseases, neurodegenerative diseases (such as Scrape, Alzheimer's disease, and Creutzfeldt-Jakob diseases) or viral infections. The heparanase coding sequence is particularly useful in cinfections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New

                                                                                          protein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples. They may also be used to study the expression and function of secretory proteins/membrane polypeptides and their role in metabolism. The polypeptides may be used as antigens in the production of antibodies against them and in assays to identify modulators (agonists and antagonists) of expression and activity. The antibodies and antagonists may also be used as therapeutic agents to down regulate expression and activity. The antibodies and antagonists may also be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid
                                                                                                                                                                                                                                                                                                                                                                              which encode human secretory or membrane proteins represented by AAB88317 - AAB88419. Included in the invention are primers AAB88317 - AAF82295 and AAF62232 - AAF62235 which are used to isolate the CDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA sequences, which can be used in vaccines. The polymucleotide sequences can be used in gene therapy. The polymucleotide sequences and the proteins they encode may be used in the prevention, treatment and sequences are the polymucleotide sequences.

                                                                                                                                                                                                                                                  The invention relates to nucleic acid sequences that encode heparanase enzymes having endoglucuronidase activity. Recombinant heparanases are capable of removing the HS side chain from heparan sulfate proteoglycan (HSPG). Sulfated oligosaccharides, sulphonates or HSPG can be used to inhibit heparanase, this is useful for treatment of a physiological or medical condition associated with elevated heparanase activity, such as metastasis, angiogenesis, wound healing, angioplasty-induced restenosis, arteriosclerosis, atherosclerosis and inflammation. The human, murine and rat heparanases can be used to enhance wound healing, especially associated with tissue development and repair. The conditions mentioned above can be diagnosed using specific antibodies, and also using primers and probes specific for the heparanase polynucleotides. Other uses of the heparanases include sequencing sulfated molecules such as HSPG.
